

I am very concern about the transmitting of inter-net service over the power lines. With the frequencies being transmitting covering the entire HF bands I think there could be a lot of trouble on the lines. As you know Japan did test concerning this and decided that these lines were not suitable for the transmission of data for this reason. With amateur radio being called one of the first of the first responders by the department of Homeland Security I would think

that the FCC would be more incline to protect them rather than do anything to to harm amatuer radio as well as SWL. While I understand your desire to have broadband inter-net adavailable to more of the population I believe the means we have to deliver it now are adequate and will become more so in the near future.

Thank you
